

## Chemistry Higher level Paper 3

Thursday 8 November 2018 (morning)

	Car	ıdıda	te se	ssior	า num	nber	

1 hour 15 minutes

#### Instructions to candidates

- Write your session number in the boxes above.
- Do not open this examination paper until instructed to do so.
- Answers must be written within the answer boxes provided.
- A calculator is required for this paper.
- A clean copy of the **chemistry data booklet** is required for this paper.
- The maximum mark for this examination paper is [45 marks].

Section A	Questions
Answer all questions.	1

Section B	Questions
Answer all of the questions from one of the options.	
Option A — Materials	2 – 5
Option B — Biochemistry	6 –11
Option C — Energy	12 – 15
Option D — Medicinal chemistry	16 – 23

#### Section A

Answer all questions. Answers must be written within the answer boxes provided.

1. Alloys containing at least 60 % copper reduce the presence of bacteria on their surface. The percentage of copper in brass, an alloy of copper and zinc, can be determined by UV-vis spectrometry.

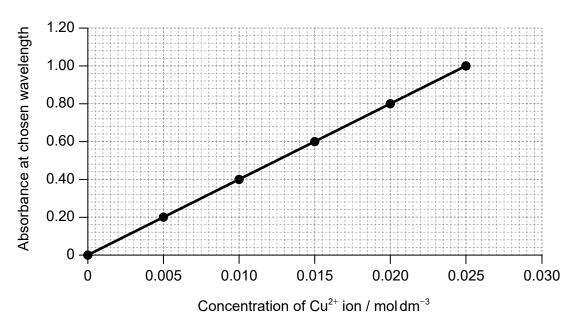

A sample of brass is dissolved in concentrated nitric acid and then made up to 250.0 cm<sup>3</sup> with water before analysis.

$$Cu(s) + 4HNO_3(aq) \rightarrow Cu(NO_3)_2(aq) + 2NO_2(g) + 2H_2O(l)$$

$$3Zn(s) + 8HNO_3(aq) \rightarrow 3Zn(NO_3)_2(aq) + 2NO(g) + 4H_2O(l)$$

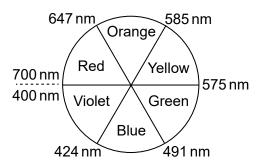

The concentration of copper(II) ions in the resulting solution is then determined from a calibration curve, which is plotted by measuring the light absorbance of standard solutions.

Calibration curve

You may find the following chart and diagram helpful.

Colour wheel

[1]

## (Question 1 continued)

(g) Titration is another method for analysing the solution obtained from adding brass to nitric acid.

Copper(II) ions are reduced to copper(I) iodide by the addition of potassium iodide solution, releasing iodine that can be titrated with sodium thiosulfate solution,  $Na_2S_2O_3$  (aq). Copper(I) iodide is a white solid.

$$4I^{-}(aq) + 2Cu^{2+}(aq) \rightarrow 2CuI(s) + I_{2}(aq)$$

$$I_2(aq) + 2S_2O_3^{2-}(aq) \rightarrow 2I^-(aq) + S_4O_6^{2-}(aq)$$

Suggest why the end point of the titration is difficult to determine, even with the addition of starch to turn the remaining free iodine black.

## **Section B**

Answer **all** of the questions from **one** of the options. Answers must be written within the answer boxes provided.

## Option A — Materials

2.	One way o	it classitying i	materials is	based on t	the type of t	oonding present.

(b) Structures of poly(methyl acrylate), PMA, and Bakelite® are shown.

#### **PMA**

$$H_3C$$
 $C$ 
 $C$ 
 $C$ 

## Bakelite<sup>®</sup>

Suggest, giving reasons, which is the thermoplastic polymer and which is the thermosetting polymer.

Thermoplastic polymer:

Thermosetting polymer:

## (Option A, question 2 continued)

(c) One reaction to convert cyclohexanone to caprolactam using concentrated sulfuric acid as a catalyst is shown.

A zeolite is an alternative catalyst for this reaction. Explain how zeolites act as selective catalysts.

[2]

(d) Caprolactam reacts with water to form compound **X**, a monomer.

(i) State the names of the two terminal functional groups in **X**. [1]

#### (Option A, question 2 continued)

(ii) Deduce the repeating unit of the polymer of **X**.

[1]

(iii) Repeating units of several polymers are listed.

Polystyrene (PS)

$$\begin{bmatrix}
CH_3 \\
-CH-CH_2
\end{bmatrix}$$
Polyvinyl chloride (PVC)

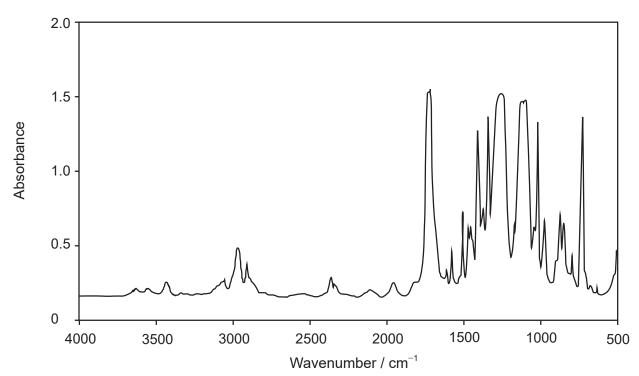

$$\begin{bmatrix}
CH_2 \\
-CH_2
\end{bmatrix}$$
Polyvinyl chloride (PVC)

Polyvinyl chloride (PVC)

Polyvinyl chloride (PVC)

Polyvinyl chloride (PVC)

The infrared (IR) spectrum of one of these polymers is shown.

(c) Electrolysis is used to obtain lead from Pb<sup>2+</sup>(aq) solution.

Determine the time, in hours, required to produce 0.0500 mol lead using a current (I) of 1.34A. Use section 2 of the data booklet and the equation, charge (Q) = current (I) × time (t, in seconds).

	(d)	Che	ating agents can be used to treat heavy metal poisoning.	
		(i)	State <b>one</b> feature of a chelating agent.	[1]
		(ii)	An aqueous lead(II) ion reacts with three ethane-1,2-diamine molecules to form an octahedral chelate ion.	
			Outline why the chelate ion is more stable than the reactants.	[1]
1.	Whi	e hea	ting solid cholesteryl benzoate, Reinitzer discovered the liquid crystal phase.	
	(a)	Outl	ne <b>two</b> observations that he could have made.	[2]

Turn over

## (Option A, question 4 continued)

(b) The structure of biphenyl nitrile is shown.

$$H_3C$$
  $C \equiv N$ 

Describe, giving a reason, a feature of the molecular structure, other than its polarity, that allows biphenyl nitrile to show liquid crystal behaviour.

_	_						
•	٠	•	٠	٠			
-	-	-	-	-			

[1]

(c) Arc discharge, consisting of two inert metal electrodes in a liquid solvent, is one method of producing carbon nanotubes (CNTs).

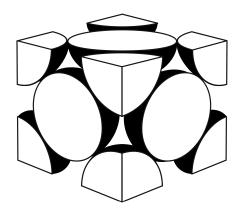

Predict, giving a reason, the electrode at which the solvent cyclohexane,	$C_6H_{12}$ ,	will
decompose to form CNTs.		

[2]	_		
	ſ	21	

## (Option A continued)

**5.** A representation of the unit cell of gold is shown.

(a)	(i)	State the name of the crystal structure of gold.	[1]
	(ii)	Calculate the number of atoms per unit cell of gold, showing your working.	[2]

Turn over

## (Option A, question 5 continued)

(b)	The edge length of the gold unit cell is $4.08 \times 10^{-8}$ cm.
	Determine the density of gold in g cm <sup>-3</sup> , using sections 2 and 6 of the data booklet. [3]

## **End of Option A**

## Option B — Biochemistry

6.	Dieta	ary recommendations are made by scientists.	
	(a)	The formation of proteins from amino acids is an example of an anabolic reaction in the human body.	
		State the source of energy for such a synthetic reaction.	[1]
	(b)	Suggest why it is advisable for those living in northerly or southerly latitudes (that is away from the equator) to take vitamin D supplements during the winter.	[1]
	(c)	Explain how a xenobiotic is biomagnified.	[2]

Turn over

## (Option B continued)

Genetic information is stored in DNA.	
(a) State the feature of DNA that determines the primary structure of proteins syn by a cell.	nthesised [1]
(b) Suggest one concern about the use of genetically modified, GM, food.	[1]
Enzymes are mainly globular proteins.  (a) Describe the interaction responsible for the secondary structure of a protein.	[2]
	by a cell.

## (Option B, question 8 continued)

(b)	Explain the action of an enzyme and state one of its limitations.	[3]
En	zyme action:	
Lir	mitation:	

(c) Contrast the actions of non-competitive and competitive inhibitors of an enzyme and state their effects on the maximum rate of reaction,  $V_{\max}$ , and the Michaelis–Menten constant,  $K_{\min}$ .

[4]

	Action of inhibitor	Effect on $V_{\text{max}}$	Effect on K <sub>m</sub>
Non-competitive			
Competitive			

**Turn over** 

[3]

## (Option B continued)

- **9.** Lipids play several roles in our bodies.
  - (a) The iodine number is the maximum mass of iodine that reacts with 100 g of an unsaturated compound.

Determine the iodine number of stearidonic acid,  $C_{17}H_{27}COOH$ .

(b)	State t	:wo fun	ctions of	lipids in th	ne body.	 		
(b)	State t	wo fun	ctions of	lipids in th	ne body.	 	 	
(b)	State t	wo fun	ctions of	lipids in th	ne body.	 	 	
(b)	State 1	wo fun	ctions of	lipids in th	ne body.	 	 	

## (Option B continued)

**10.** Lactose, found in milk and dairy products, is a disaccharide formed from two different monosaccharides. The structure of lactose is shown with numbered carbon atoms.

(a)	Name the type of link between the two monosaccharide residues.	[1]
(b)	Outline how the two monomer structures, galactose and glucose, differ.	[1]

(c) Starch and cellulose are both formed from glucose and have similar structures.

		(1	)	(	Οι	ıtı	ıne	e i	th	e (	d۱	Ħ€	ere	er	ıc	е	b	et	W	ee	en	tl	ne	ır	Si	tru	IC	tu	re	S.															[1

- **11.** The transport of oxygen around the body is essential for life.
  - (a) A graph showing saturation of oxygen against partial pressure of oxygen is shown.

Explain the shape of the graph from 0 to 50% saturation.

[2]

## (Option B, question 11 continued)

(D)	monoxide poisoning.	[2]
Toxi	icity:	
Trea	atment:	

**End of Option B** 

## Option C — Energy

12.	The Sun's energy is produced by the fusion of hydrogen nuclei.							
	(a)	Explain fusion reactions with reference to binding energy.	[2]					
	(b)	Uranium-238 produces plutonium-239, which is used as fuel in breeder reactors.						
		(i) Outline why the term breeder is used for the reactors.	[1]					
		(ii) Deduce the fission reaction when <sup>239</sup> Pu is bombarded with a neutron to produce <sup>133</sup> Xe and <sup>103</sup> Zr.	[1]					
	(c)	Nuclear disasters release radioactive caesium into the atmosphere, which presents serious health risks.						
		Cs-137 has a half-life of 30 years.						
		Calculate the percentage of Cs-137 remaining in the atmosphere after 240 years.	[2]					

## (Option C, question 12 continued)

	(d)	Nucl	ear energy produces ionizing radiation which leads to the formation of free radicals.	
		(i)	Deduce a Lewis (electron dot) structure of the superoxide, O <sub>2</sub> -, free radical.	[1]
		(ii)	Explain why free radicals are harmful to living cells.	[2]
13.	Coa	l can b	pe converted to clean-burning synthetic natural gas.	
	(a)	Forn	nulate equation(s) for the conversion of coal and steam to methane.	[1]

Turn over

[1]

## (Option C, question 13 continued)

(b) Automobile companies use hydrogen as an alternative to fossil fuels. Some properties of fuels are shown.

Compound	Molar mass / g mol <sup>-1</sup>	Density at STP / g dm <sup>-3</sup>	Δ <b>H</b> <sub>c</sub> / kJ mol <sup>-1</sup>	Energy density at STP / kJ dm <sup>-3</sup>	Specific energy / kJ g <sup>-1</sup>
Hydrogen	2.02	0.0890	-286	12.6	141.6
Methane	16.05	0.707	-891	39.3	55.5

Comment on the specific energies of hydrogen and methane.

(c) Calculate the mass, in kg, of carbon dioxide produced by the complete combustion of  $72.0\,\mathrm{dm^3}$  octane,  $\mathrm{C_8H_{18}}$ .

Density of  $C_8H_{18} = 703 \, g \, dm^{-3}$ 

$$C_8H_{18}(l) + 12.5O_2(g) \rightarrow 8CO_2(g) + 9H_2O(g)$$
 [2]

## (Option C continued)

14.	Solar energy, which is freely available, is indispensable to life on earth.							
	(a)	Suggest another advantage and one disadvantage of solar energy.	[2]					
	Adva	antage:						
	Disa	dvantage:						
	(b)	(i) State a physical property of vegetable oils that makes them very difficult to use as fuel in internal combustion engines.	[1]					
		(ii) Describe how vegetable oils can be converted to a more suitable fuel.	[1]					
	(c)	Contrast the importance of carbon dioxide and methane as greenhouse gases.	[2]					

(Option C continues on page 29)

**Turn over** 

## (Option C, question 14 continued)

	(d)	Explain, using an equation, the effect of increased carbon dioxide in the atmosphere on the pH of lake water.	[2]
15.	Che	mical energy from redox reactions can be used as a source of electrical energy.	
	(a)	Outline how a rechargeable battery differs from a primary cell.	[1]
	(b)	Formulate half-equations for the reactions at the anode (negative electrode) and cathode (positive electrode) during discharge of a lithium-ion battery.	[2]
	Ano	de (negative electrode):	
	Cath	node (positive electrode):	

#### (Option C, question 15 continued)

(c) A voltaic cell consists of a nickel electrode in 1.0 mol dm<sup>-3</sup> Ni<sup>2+</sup>(aq) solution and a cadmium electrode in a Cd<sup>2+</sup>(aq) solution of unknown concentration.

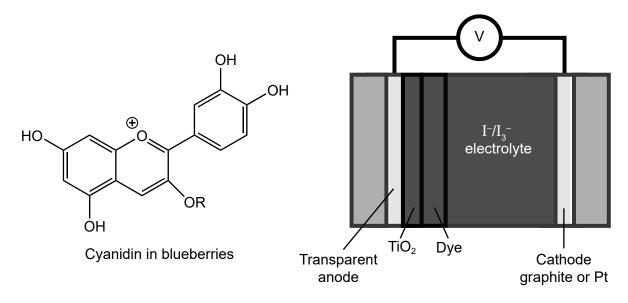

$$Cd(s) + Ni^{2+}(aq) \rightarrow Cd^{2+}(aq) + Ni(s)$$
  $E_{cell}^{\ominus} = 0.14 \text{ V}$ 

Determine the concentration of the Cd<sup>2+</sup>(aq) solution if the cell voltage, *E*, is 0.19 V at 298 K. Use section 1 of the data booklet.

[2]

[1]

(d) The chemical structure of a photosensitive dye found in blueberries and a schematic diagram of a solar cell are shown.

(i) Identify the structural feature of the dye that allows the conversion of solar energy into electrical energy.

.....

## (Option C, question 15 continued)

(ii)	Outline the effect of sunlight on the dye in the solar cell.	[1]
(iii)	State the purpose of TiO <sub>2</sub> .	[1]
(iv)	Deduce the reduction half-equation at the cathode.	[1]

# **End of Option C**

## Option D — Medicinal chemistry

- **16.** The structure of penicillin is shown in section 37 of the data booklet.
  - (a) State the internal bond angles in the  $\beta$ -lactam ring and the expected bond angles in sp<sup>2</sup> and sp<sup>3</sup> hybridised atoms.

[2]

	Bond angle
β-lactam ring	
sp <sup>2</sup>	
sp <sup>3</sup>

caused by over prescription. [1]	(c)	State how the structure of penicillin can be modified to combat the effect of resistance	
		caused by over prescription.	[1]

(d)	Suggest why human cells are not affected by penicillin.	[1]

## (Option D continued)

<ol><li>Opiates are strong a</li></ol>	naldesics.
--	------------

(a)	morphine.	[2]
(b)	Outline the meaning of the bioavailability of a drug.	[1]

- **18.** Buffer systems control pH in the body.
  - (a) Determine the pH of a buffer solution that is 0.0100 mol dm<sup>-3</sup> sodium hydrogen carbonate and 0.0200 mol dm<sup>-3</sup> sodium carbonate, using section 1 of the data booklet.

 $K_{\rm a}$  (hydrogen carbonate ion) =  $4.8 \times 10^{-11}$  [2]

# (Option D, question 18 continued) State the equation for the reaction of calcium carbonate, the active ingredient in some antacids, with stomach acid. [1] (c) Suggest a technique for measuring the percentage mass of calcium carbonate in this type of antacid tablet. [1] 19. Viruses and bacteria both cause diseases and are frequently confused. Outline two different ways in which antiviral medications work. [2]

## (Option D continued)

**20.** Suggest **two** reasons why chlorinated solvents should neither be released into the atmosphere nor incinerated (burnt).

[2]

- 21. Taxol is a chiral cancer drug which is synthesized using a chiral auxiliary.
  - (a) The diagram shows part of a Taxol molecule in skeletal form.

Draw a circle around each chiral carbon.

[1]

(b) Outline how chiral auxiliaries are used to synthesize the desired enantiomer. [2]
